

# **Testing box type E-RI-TEST**

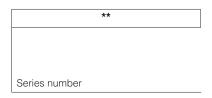

for proportional valves with integral electronic driver

# 1 MODEL CODE

main connector

# **E-RI-TEST** Testing box for valves with integral electronics and 7 pin

E-RI-TEST testing box allows to test and start-up proportional valves with integral transducer and electronic driver with 7 main pins connector.

It is supplied with 2 m cable with 7 pin main connector to direct interface the valve's driver to test.

E-RI-TEST can be used in two operate modalities thanks to a switch selector placed on the frontal panel:

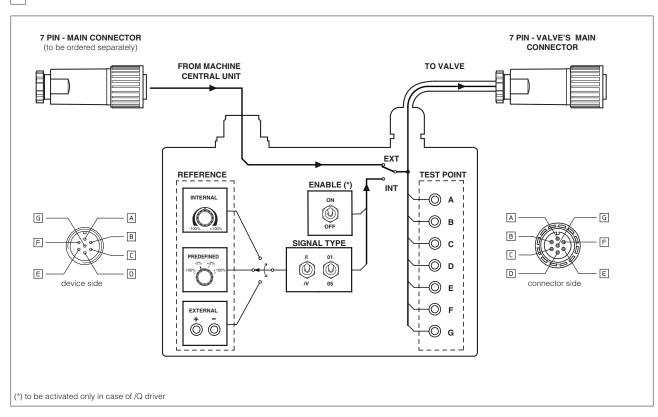

#### Test:

• the E-RI-TEST has to be connected between the machine central unit 1) and the proportional valve (2). During normal working it is possible to monitor the state and value of all signals of the 7 pins connector. It is not necessary to supply the valve's electronic driver.

**Start-up:**• the E-RI-TEST operates by multiselectable potentiometers and switches selectors placed on the frontal panel. With this mode it is possible to start-up the valve with preliminar movements at low speed thanks to an internal reference generator. The machine central unit (1) and all signal management have not to be connected to the E-RI-TEST.

The power supply must be connected to the pin A, B of the main connector (see section 3).

# 2 BLOCK DIAGAGRAM

# 3 ELECTRONIC CONNECTIONS

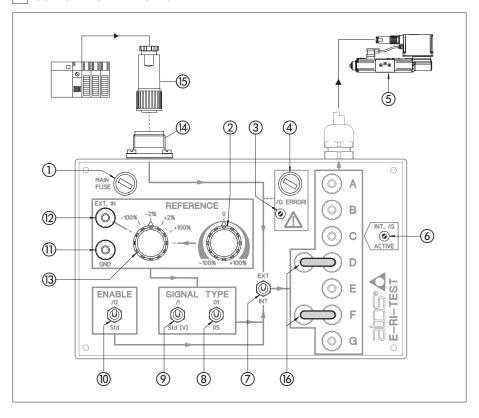

PIN	SIGNAL	TECHNICAL SPECIFICATIONS	NOTES
А	V+	Power supply 24 VDC for solenoid power stage and driver logic	Input - power supply
В	VO	Power supply 0 Vpc for solenoid power stage and driver logic	Gnd - power supply
C (1)	AGND	Ground - signal zero for MONITOR signal	Gnd - analog signal
	ENABLE	Enable (24 VDC) or disable (0 VDC) the driver (for /Q option)	Input - on/off signal
D	INPUT+	Reference analog differential input: ±10 Vpc maximum range (4 ÷ 20 m. For single solenoid valves: 0÷10 Vpc (4 ÷ 20 mA for /l	
Е	INPUT -	For double solenoid valves: $\pm 10 \text{ VDC}$ $(4 \div 20 \text{ mA for /I})$	, , , ,
F (2)	MONITOR	Monitor analog output: ±10 Vpc maximum range (4 ÷ 20 mA for /I	option) Output - analog signal
	FAULT	Fault (0Vbc) or normal working (24Vbc) (for /F option)	Output - on/off signal
G	EARTH	Internally connected to the test adapter housing	

Notes (1) with /Q option ENABLE signal replaces AGND on pin C; MONITOR signal is referred to pin B (2) with /F option FAULT signal replaces MONITOR on pin F

# 4 TECHNICAL CHARACTERISTICS

Power supply	Nominal: +24 Vpc rectified and filtered: Vrms = 20 ÷ 32 VMAX (ripple max 10 % VPP)		
Max. power consumption	10 W		
Reference input signal	Voltage: ±10 Vpc Current: 4 ÷ 20 mA		
Input signal impedance	Voltage: Ri > 50 k $\Omega$ Current: Ri = 316 $\Omega$		
External potentiometers Reference	±2% of input signal range - to be used for positive/negative bias setting ±100% of input signal range - to be used for positive/negative scale setting Continous range ±100% - to beused for preliminar movements		
Box format	plastic box with alluminium frontend. IP20 protection degree		
Operating temperature	-20 ÷ 60 °C (storage -20 ÷ 70 °C)		
Dimensions	215x130x70mm		
Mass	1,2 kg (included cable + connector)		

# 5 COMPONENTS IDENTIFICATION

- 1) Main fuse, 4A
- Internal reference potentiometer: ±100%
- 3 Enable signal in pin C;
- Protection fuse in case pin C is supplied by Enable signal (on valves without /Q option)
- ⑤ Proportional valve
- 6 LED on when Enable is active
- 7 Internal / External reference selector
- (8) Monosolenoid (01) / bisolenoid (05) valve selector
- Voltage (Std V) / Current (/I)
  reference selector
- Enable signal selector to be used only on valves with /Q option)
- (11) GND external reference plug
- Positive external reference plug
- (13) Reference multi selector
- 7 pin panel male connector
- (5) 7 pin main female connector and cable from PLC (not included on the supply)
- 16 Jumpers (see 6.4)

# 6 OPERATING WITH E-RI-TEST

The E-RI-TEST must be interposed between the Machine Control Unit through the main connector (§) and the proportional valve (§) through the annexed connector and cable.

#### 6.1 Power supply

The power supply must be provided through pin A and B of the main connector of the E-RI-TEST.

A safety fuse is present in series to the power supply: Ø 5 x 20 (4A, F).

Never use the test point A and B to provide power supply to the valve connected: these test points must be used to check power supply presence on the pin A and B of proportional valve main connector.

#### 6.2 External reference signal

It is used for test operations and it is active with switch ⑦ set to **EXT**. In this condition it is required to connect the Machine Control Unit connector ② to the plug ⑤ and to connect E-RI-TEST to the main connector of the proportional valve ⑤. The user can monitor the valve's signals using the test point available on the front panel of the device (see section ② for details).

- pins A..G replicate the correspondent ones of the integral electronics and it is possible to measure the relevant signals;
- -/Q fuse ④ protects erroneous enable signal (24Vpc) on pin C if the electronic driver is not equipped with /Q function: in this case light ③ is on. Replace the fuse and check selector ⑩ is on Std position

## 6.3 Internal reference signal

This configuration is used for start-up operation, and it is active with switch  $\bigcirc$  set to  ${\bf INT}.$ 

Possible functions:

- to run preliminar valve movement
- to change settings through the reference multi-selector (3) of device front panel
- to test or change the valve's parameter settings

It is not requested the Machine Control Unit.

- pins A...G: connect these pins to monitor the relevant signals according to the electronic connections (see section 3)
- enable (1) for /Q option: when it is active the light (6) is on. If the enable pin is wrong connected, the light (3) is switched on
- reference type (V, I) internal position by selector (9) and valve configuration selection (8)

(pos. 01: ref. 4  $\div$  20mA / 0  $\div$  10V; pos. 05: ref. 4  $\div$  20mA / 0  $\div$  10V)

- reference signal can be supplied as follows:
  - selector (3) set to EXT.IN: any external reference signal can be supplied to the female jacks (11) and (20);
  - selector ③ set at -100%, or -2%, or +2%, or +100%: this way maximum and threshold reference signals are selected;
  - selector 3 set to enable the internal reference 2: any reference signal can be selected on potentiometer on the range  $\pm 100\%$

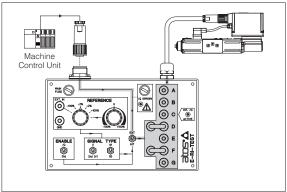

### 6.4 Jumpers

Jumpers (a) are used to simplify any measurements with external multimeters:

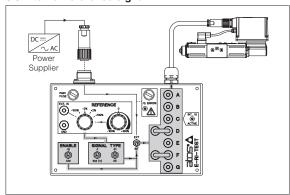

- voltage measurement (8): connect probes between D or F pins and system ground

Note: Jumpers must be connected for regular working operations.
