# Series HP 31 6000 PSI

1) Connect the stand grounding tab to a suitable earth ground point.

## Pressure Filter Series HP 31 6000 PSI

### **Description:**

Pressure filter series HP 31 have a working pressure up to 6000 PSI. Pressure peaks can be absorbed with a sufficient safety margin. The HP-filter is in-line mounted.

The filter element consists of star-shaped, pleated filter material, which is supported on the inside by a perforated core tube and is bonded to the end caps with a high-quality adhesive. The flow direction is from outside to inside. Filter elements are available down to 4 µm(c).

Eaton filter elements are known for high intrinsic stability and an excellent filtration capability, a high dirt-retaining capacity and a long service life.

Eaton filter elements are suitable for all petroleum based fluids, HW-emulsions, most synthetic hydraulic fluids and lubrication oils

Eaton filter elements are available up to a pressure resistance of Δp 2320 PSI and a rupture strength ofΔp 3625 PSI.

The bypass valve is integrated into the filter head.

After reaching the bypass pressure setting, the bypass valve will send unfiltered partial flow around the filter.

## Pressure drop flow curves:

## Filter calculation/sizing

The pressure drop of the assembly at a given flow rate Q is the sum of the housing  $\Delta p$  and the element  $\Delta p$  and is calculated as follows:

 $\Delta p$  assembly =  $\Delta p$  housing +  $\Delta p$  element  $\Delta p$  housing = (see  $\Delta p$  = f (Q) - characteristics)

$$\varDelta p_{\, \textit{element}} \, (\textit{PSI}) = \; \; Q \, \left( \textit{GPM} \right) \, x \, \, \frac{\textit{MSK}}{1000} \left( \frac{\textit{PSI}}{\textit{GPM}} \right) x \; \, \nu \left( \textit{SUS} \right) \, x \, \, \frac{\rho}{0.876} \left( \frac{kg}{dm^3} \right)$$

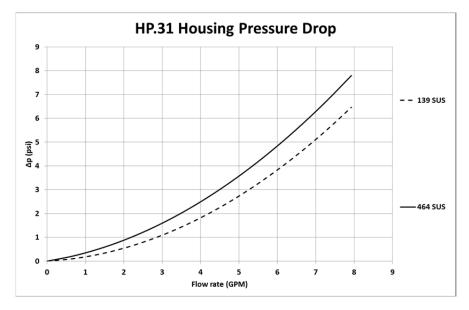

For ease of calculation our Filter Selection tool is available online at <a href="www.eatonpowersource.com/calculators/filtration/">www.eatonpowersource.com/calculators/filtration/</a>

#### Material gradient coefficients (MSK) for filter elements

The material gradient coefficients in psi/gpm apply to mineral oil (HLP) with a density of 0.876 kg/dm³ and a kinematic viscosity of 139 SUS (30 mm²/s). The pressure drop changes proportionally to the change in kinematic viscosity and density.

## Pressure Filter Series HP 171-451 6000 PSI

## **Description:**

Pressure filter series HP 171-451 have a working pressure up to 6000 PSI. Pressure peaks can be absorbed with a sufficient safety margin. The HP-filter is in-line mounted.

The filter element consists of star-shaped, pleated filter material, which is supported on the inside by a perforated core tube and is bonded to the end caps with a high-quality adhesive. The flow direction is from outside to inside. Filter elements are available down to 4  $\mu m_{(c)}$ .

Eaton filter elements are known for high intrinsic stability and an excellent filtration capability, a high dirt-retaining capacity and a long service life.

Eaton filter elements are suitable for all petroleum based fluids, HW-emulsions, most synthetic hydraulic fluids and lubrication oils.

Eaton filter elements are available up to a pressure resistance of  $\Delta p$  2320 PSI and a rupture strength of  $\Delta p$  3625 PSI.

The bypass valve is integrated into the filter head.

After reaching the bypass pressure setting, the bypass valve will send unfiltered partial flow around the filter.

The reversing valve provides another level of protection for the filter element. The reverse flow will not be filtered.

## 1. Type index:

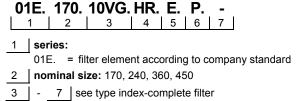

1.1. Complete filter: (ordering example)

i.i. Complete inter. (ordening example)
HP. 171. 10VG. HR. E. P UG. 5 AE
1 2 3 4 5 6 7 8 9 10 11 12
1 series:
HP = pressure filter
2 <b>nominal size:</b> 171, 241, 361, 451
3 filter-material and filter-fineness:
80G, 40G, 25G, 10G stainless steel wire mesh 25VG, 16VG, 10VG, 6VG, 3VG microglass
4 filter element collapse rating:
30 = ∆p 435 PSI HR = ∆p 2320 PSI (rupture strength ∆p 3625 PSI)
5 filter element design:
E = single-end open
6 sealing material:
P = Nitrile (NBR) V = Viton (FPM)
7   filter element specification: (see catalog)
- = standard
VA = stainless steel
IS06 = for HFC applications, see sheet-no. 31601
8 process connection:
UG = thread connection
9 process connection size:
5 = -16 SAE 6 = -20 SAE
7 = -24 SAE
10 filter housing specification: (see catalog)
- = standard
IS06 = for HFC applications, see sheet-no. 31605
11 internal valve:
- = without
S1 = with by-pass valve Δp 51 PSI S2 = with by-pass valve Δp 102 PSI
R = reversing valve, Q ≤ 55.75 GPM
12 clogging indicator or clogging sensor:
- = without
AOR = visual, see sheet-no. 1606 AOC = visual, see sheet-no. 1606
ACC = visual, see sheet-no. 1605 AE = visual-electric, see sheet-no. 1615

To add an indicator to your filter, use the corresponding indicator data sheet to find the indicator details and add them to the filter assembly model code.

## 1.2. Filter element: (ordering example)

VS5 = electronic, see sheet-no. 1619

design temperature: 14 °F to +212 °F operating temperature: 14 °F to +176 °F

operating medium mineral oil, other media on request

max. operating pressure: 6000 PSI test pressure: 8580 PSI

process connection: thread connection housing material: C-steel

sealing material: Nitrile (NBR) or Viton (FPM), other materials on request

installation position: vertical

Classified under the Pressure Equipment Directive 2014/68/EC for mineral oil (fluid group 2), Article 4, Para. 3. Classified under ATEX Directive 2014/34/EC according to specific application (see questionnaire sheet-no. 34279-4).

## Pressure drop flow curves:

#### Filter calculation/sizing

The pressure drop of the assembly at a given flow rate Q is the sum of the housing  $\Delta p$  and the element  $\Delta p$  and is calculated as follows:

 $\Delta p$  assembly =  $\Delta p$  housing +  $\Delta p$  element  $\Delta p$  housing = (see  $\Delta p$  = f (Q) - characteristics)

$$\varDelta p_{\, \textit{element}} \, (\textit{PSI}) = \; \; Q \, \left( \textit{GPM} \right) \, x \, \, \frac{\textit{MSK}}{1000} \left( \frac{\textit{PSI}}{\textit{GPM}} \right) x \; \, \nu \left( \textit{SUS} \right) \, x \, \, \frac{\rho}{0.876} \, \left( \frac{kg}{dm^3} \right)$$

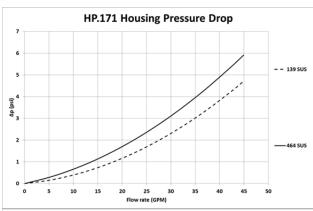

For ease of calculation our Filter Selection tool is available online at <a href="https://www.eatonpowersource.com/calculators/filtration/">www.eatonpowersource.com/calculators/filtration/</a>

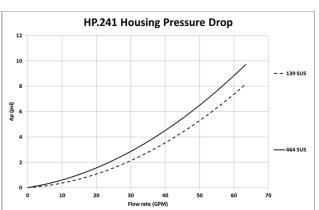

#### Material gradient coefficients (MSK) for filter elements

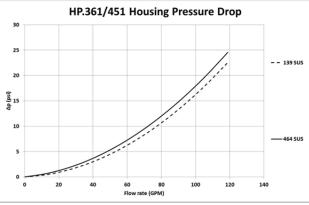

The material gradient coefficients in PSI/GPM apply to mineral oil (HLP) with a density of 0.876 kg/dm³ and a kinematic viscosity of 139 SUS (30 mm²/s). The pressure drop changes proportionally to the change in kinematic viscosity and density.
