GENERAL INFORMATION

Features

- Silent running
- High rotation speed
- Compact design
- Suitable for multiple pump assembly
- Easy maintenance
- Built-in pressure relief valves
- Optionals: screw or lever-type by-pass-valve, purge valve, adapter flange from SAE-A to SAE-B

- Accessories: auxiliary gearpumps, hydraulic and electric remote controls, mounting kit for diesel and petrol engines

All HANSA-TMP's TPV pumps are tested dynamically and statically to ensure the quality of our product.

TPV pumps are variable displacement axial piston pumps, with swashplate system, for closed loop hydrostatic transmissions

PERFORMANCE DIAGRAM

GENERAL INSTRUCTIONS

- During the assembly, check that pump is in line and concentric with the driveshaft sleeve to prevent overloading of the pump shaft bearing.
- Clean carefully all tanks and pipes internally before assembly.
- The pipe internal diameter must be suitable for the max oil speed through it.
- It is advisable to fit the pump below the oil level of tank.
- Heat exchangers must be considered in the machine design, to keep temperature level within the limit of 80°C.

Multiple Pumps

- In case of installing a multiple pump it is advisable to mount a supplementary support.

Maximum Shaft Torque

In the case of installation of multiple pump, verify that the total shaft torque is not more than the maximum value rated for each type of shaft.

Optional

The TPV pumps can be supplied in different versions, with different types of shaft and equipped with different types of control devices and optionals:

- Direct mechanical control lever DM
- Spring zero return DMS
- Hydraulic servo-control SHI
- Electric proportional servo-control SEI
- By-pass lever LB
- Screw By-pass SB

- Purge valve VS
- Adaptor flange from SAE-A to SAE-B FB
- Adaptor coupling Z = 9 / Z = 13 ST
- Purge valve + By-pass lever VSLB

First Starting

- Before starting fill all the system components with new and filtered oil.
- Verify that the boost pressure is correct.
- Restore the tank oil level.

Maintenance

- The first oil change must be made after approximately 500 hours of operation. In the following every 2000 hours.
- The filter cartridge must be replaced for the first time after 50 hours. In the following 500 hours; such time should be reduced if the filter clogging indicator shows that the cartridge is clogged or when the system works in a heavily polluted environment.

DRIVE SHAFTS

SS2

SPLINED SHAFT Z = 9

Max. torque = 120 Nm

PS1

PARALLEL KEYED SHAFT 15,875 mm. diam.

Max. torque = 65 Nm

(available only for single pump)

(continued)
DRIVE SHAFTS

PS3

PARALLEL KEYED SHAFT 18 MM. DIAM.

Max. torque = 85 Nm

SS3

SPLINED SHAFT Z = 13

(available only for SHI, SEI and F2.1)

Max. torque = 320 Nm

Attention: for the application of multiple pumps the total absorbed torque must not exceed the shown value.

MOUNTING FLANGE

F1

SAE-A - 2 BOLT FLANGE

F2.1

SAE-B - 2 BOLT FLANGE

(available only for SHI, SEI and SS3)

Valid only for version F2.1

DM

DIRECT MECHANICAL WITHOUT CONTROL LEVER

The change of pump displacement is given by clockwise or counter-clockwise rotation of the shaft of the swashplate.

The shaft is directly linked with the swashplate.

FLOW DIRECTION	PUMP		
	Lever position	OUT	IN
Clockwise CR	X	A	B
	Y	B	A
Counter-clockwise CC	X	B	A
	Y	A	B

Valid for all type of direct controls

BC

TAPERED BUSH

Tapered bush with woodruff key, external cylindrical.
Suitable for arrangement of specific control levers.

LC

DIRECT MECHANICAL CONTROL WITH LEVER

The pump displacement variation is given by clockwise or counter-clockwise movement of the lever. The lever shaft is directly linked to the swashplate.

Lever Angle											
Pump Model	6 / 7	8 / 7	9 / 7	11 / 7	12 / 7	13 / 7	15 / 9	17 / 9	18 / 9	19 / 9	21 / 9
Lever Angle (X - Y)	10°	12°	13°	15°	17°	18°	15°	17°	18°	19°	19°

FLOW DIRECTION	PUMP		
	Lever position	OUT	IN
Clockwise CR	X	A	B
	Y	B	A
Counter-clockwise CC	X	B	A
	Y	A	B

DMS

CONTROL LEVER WITH RETURN TO ZERO FLOW POSITION

(torsion spring)

The pump displacement variation is given by a clockwise or counter-clockwise movement of the lever.

Return to zero flow is obtained by a spring which is part of the leverism.

The lever shaft is directly linked to the swashplate.

Lever Angle

Pump Model	6 / 7	8 / 7	9 / 7	11 / 7	12 / 7	13 / 7	15 / 9	17 / 9	18 / 9	19 / 9	21 / 9

Clockwise CR	X	B	A
	Y	A	B

(continued)

DMZ

CONTROL LEVER WITH RETURN TO ZERO FLOW POSITION

(compression spring)

HYDRAULIC DIAGRAM

SHI

HYDRAULIC SERVO-CONTROL

The variation in pump displacement is obtained by adjusting the pressure on the P1-P2 servo control connections by means of a hydraulic proportional joystick (containing pressure reducing valves).

The oil supply for the joystick can be obtained by taking pressure from the boost pump (G port), see pag. 10.

The servo control reacting time can be adjusted by inserting a restrictor on the joystick supply line (0,5 ÷ 1,2 mm).

The servo control operation curve in both control directions goes from 0,4 to 1,8 MPa (tolerance ± 5%).

The adjustment curve of the hydraulic control system has to be wider (0,3 ÷ 1,9 MPa).
